

Here is my portfolio sitemap for a portfolio built around this proof statement: “I can turn front-end internship tasks into clear, organized, and well-documented deliverables using a practical AI-assisted workflow.” Target person: A mentor, reviewer, or startup team lead who wants someone dependable for junior front-end tasks and technical documentation. Target action: I want them to trust my work and confidently assign me front-end implementation and documentation responsibilities. Current sitemap:

1. Home – claim, short intro, featured work preview, CTA
2. Projects – FlyRank internship work, front-end projects, GitHub/documentation samples
3. About – who I am, workflow, tools, goals
4. Contact – email, LinkedIn, GitHub, CTA Please pressure-test this sitemap hard. Tell me:
5. Which page or section feels unnecessary, weak, or repetitive?
6. What is missing if the goal is to support my proof statement?
7. Does the sitemap clearly support one person and one action?
8. If you had to simplify it further, what would you change and why?

Good sitemap to pressure-test — it's already lean, so the real risk here isn't bloat, it's **vagueness dressed as minimalism**. Four pages can still fail to prove your claim if each one doesn't carry its own weight of evidence. Let's go through your four questions.

1. What's unnecessary, weak, or repetitive?

"About" is your weakest page as currently scoped. "Who I am, workflow, tools, goals" is four different things pretending to be one page, and two of them overlap with content that belongs elsewhere:

- "Workflow" competes directly with what your Projects page should be *showing*, not telling. If About says "I use AI to draft, then I review and document" and Projects doesn't actually demonstrate that, About becomes an unverified claim sitting next to unrelated bio content.
- "Goals" is the classic filler section. A team lead evaluating you for junior front-end work does not need your career aspirations. Cut it or shrink it to one sentence.

Home's "featured work preview" is only justified if it's a teaser, not a summary. If it just re-lists what's on the Projects page, it's redundant. It should feature exactly *one* flagship case study — the strongest proof of your claim — and push everyone else toward Projects for the rest.

Neither page is unnecessary to *cut*, but both are currently written as containers rather than arguments. Fix the content, not the sitemap.

2. What's missing?

This is the real gap. Your proof statement has two specific, checkable claims: **(a) clear, organized, well-documented deliverables**, and **(b) a practical AI-assisted workflow**. Nothing in your current sitemap forces either claim to be demonstrated rather than asserted.

Missing pieces:

- **A visible case-study structure inside Projects.** Not "here's a project I did" but: *problem → my process (including where/how AI was used and where I overrode or verified it) → decisions I made → the documented output → the result*. This is the single most important addition. A reviewer trusts documentation skill by *reading your documentation of your own work*, not by being told you have it.
- **An explicit "how I use AI" explanation**, short and concrete, ideally living inside About or as a subsection of a project. Team leads are currently nervous about AI-assisted juniors — they worry about sloppy, unverified, copy-pasted output. Your workflow section needs to preempt that: show the review/verification step, not just the generation step. That's what turns "AI-assisted" from a liability into your differentiator.
- **A consistent, specific CTA.** Right now Home and Contact both have "a CTA," but nothing says what it actually is. "Contact me" is not an action a busy team lead takes. You want something closer to: *"Available for junior front-end and documentation work — see how I work"* linking straight to your best case study.

3. Does it support one person, one action?

Structurally, yes — four pages, no detours into blog posts, testimonials-from-nobody, or unrelated hobby projects. That discipline is good and you should protect it.

But *content-wise*, About is the page most at risk of drifting off-target, because "who I am" invites general biography rather than answers to the reviewer's actual question: *can I hand this person a task and trust the output?* Every sentence on every page should be pressure-tested against that one question. If a sentence doesn't help answer it, it doesn't belong, regardless of which page it's on.

4. If I simplified further

I wouldn't cut a page — four is already tight. I'd re-scope what each page is *for*:

Page	Purpose	Cut	Add
Home	One-line claim + one flagship case study teaser + single CTA	Generic intro paragraph	Explicit proof statement as the first thing seen
Work (rename from "Projects")	2–3 deep case studies, not a gallery	Extra/shallow projects that dilute the strong ones	Problem → AI-assisted process → verification step → documented output → result, per project

Page	Purpose	Cut	Add
About	Short bio + explicit AI-workflow philosophy + tools	"Goals" section	3–4 sentences on <i>how</i> you use AI and <i>how</i> you verify/document, since this is evidence, not decoration
Contact	One CTA, restated in your language, plus links	Nothing to cut, just tighten	Match the CTA wording to Home's, so it reads as one campaign, not four disconnected pages
